

Your site is now editable — setup guide

This turns your portfolio into a site you can fully edit yourself, with **no coding**, from a private control panel at `aman5z.in/admin`. Follow these steps once, and you're set up for good.

What changed

Your old `index.html` had everything — text, colors, links — hard-coded into one file. Now:

- `content.json` holds all your content (text, links, images, colors, fonts, section order, hide/show flags).
- `index.html` / `render.js` / `behavior.js` together read `content.json` and draw the page. Your design is **100% unchanged** — same colors, fonts, layout, animations.
- `admin/` is your control panel — a private page only you can use (it needs your GitHub key to save anything).

Step 1 — Upload these files to your repo

Go to your repo: `github.com/aman5z/aman5z.github.io`

Upload these (drag-and-drop on the GitHub website, or "Add file → Upload files"):

- `index.html` (replace the existing one)
- `render.js`, `behavior.js`, `content.json` (new files, repo root)
- the whole `admin/` folder (creates `aman5z.in/admin`)

Commit directly to the `main` branch. Give GitHub Pages a minute, then check `aman5z.in` still looks right.

Step 2 — Get a GitHub access token (2 minutes, one time)

This lets the admin panel save your edits back to GitHub on your behalf.

1. Go to **github.com** → **click your profile photo** → **Settings**
2. Scroll to **Developer settings** (bottom of left sidebar)
3. **Personal access tokens** → **Fine-grained tokens** → **Generate new token**
4. Name it anything (e.g. "Site Admin")
5. **Repository access** → "Only select repositories" → choose `aman5z.github.io`
6. **Permissions** → find **Contents** → set to **Read and write**
7. Generate, then **copy the token** (starts with `github_pat_...`) — you won't see it again, so paste it somewhere safe temporarily

Step 3 — Open your admin panel

Go to `aman5z.in/admin`. Enter:

- GitHub username: `aman5z`
- Repository name: `aman5z.github.io`
- Branch: `main`
- Personal access token: (paste it)

Click **Connect**. Your whole site loads into editable forms.

What you can do from here

Tab	What it edits
Site & Theme	Page title/description, default light/dark theme, all colors, fonts
Top Icons	The circular link icons top-right (add/remove/reorder/hide)

Hero	Your name, photo, tagline, badges, buttons
Stats	The 4 number stat cards
About / Skills	Bio text, "What I Do" cards, skill tags
Experience	Job timeline, certifications, "Why work with me" cards
Projects	Every project card — title, links, and every block inside (paragraphs, photo galleries, parts lists, tables, tech tags) — add, remove, reorder, edit
Philosophy / Contact & Footer	Closing statement, contact buttons, footer text
Section Order	Turn whole sections or project categories on/off, and reorder them
Pages	Create a new page like <code>aman5z.in/resume</code>

- **Images:** every image field has an upload button — pick a photo, it uploads straight to your repo and swaps in automatically.
- **Save Changes** (top right): writes everything back to GitHub. Live on your site in about 30-60 seconds.
- Nothing saves until you click **Save Changes** — feel free to click around and experiment first.

Notes & limits

- Your access token is stored only in your own browser (localStorage) and is sent only to `api.github.com`. It's never sent to me or anyone else. Don't share your token, and don't use the admin panel on a public/shared computer without logging out (**Disconnect** button clears it).
- This is a structured editor, not pixel-by-pixel drag-and-drop — you edit content within your existing design blocks (cards, tables, lists), not arbitrary new layouts. That covers everything currently on your site.
- New pages start as a blank canvas (your hero/theme carried over, no projects) — build them out from the admin panel afterward.
- Keep a copy of your old `index.html` somewhere just in case you ever want to roll back.

If anything looks off after an edit, it's safe to just keep editing and hit Save again — GitHub keeps full history of every change in the repo's commit log, so nothing is ever truly lost.
